Relationships between Having Data, Knowledge, Wisdom, and Ideas, and New Knowledge After the Implementation of Wisdom
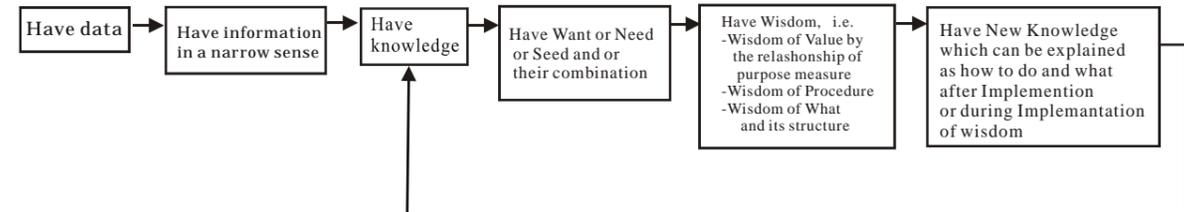

Terminology

In this paper, the discussion proceeds based on an understanding of and a definition of the terms 'having knowledge' and 'having wisdom' which follow.

(1) 'Having knowledge' means to have information of causation, i.e. 'if X happens, Y will happen,' and that of existence, or 'thing AND/OR information,' i.e. 'there is Z.'

(2) Although 'having wisdom' is several levels in depth, however in brief it can be summarized as having information of 'what and how should/would be done.'

1	Have data	Have information that is not put in useful order (data)		
2	Have information (in a narrow sense)	Data, which is put in order, becomes information.(For example, Graph or Map)		
3	Have knowledge	1. It measures knowledge of causation (Information of cause and result) 2. It measures knowledge of the existence of some thing' (Information of existence) Note: If you know that the existence of wisdom as below, then it is the same as 'having knowledge'.	Have knowledge from learning	Have knowledge acquired by learning, such as reading or hearing information in a narrow sense
			Have knowledge from experience	Have knowledge acquired by experience
4	Have "Will" start with Want(s) and/or Need(s) and/or Seed(s) and/or	(1) "To have want" means to have the purpose or desire of something to do (2) "To have seed" means to have the seed information which will create the New purpose and something to do with or for it. (3) "To have need" means to have the just practically realizable result which satisfies the upper purpose or want.		
5	Have wisdom	1. It means having "In order to do what and How to do" and following two Keywords in 'the relationship of purpose and measure': 1) The Main Keyword of 'what is the focused function to do to realize the want or need'; and 2) The Entrance Keyword of 'What is necessary to do at first, in order to get what is wanted or needed. 2. 'Having the procedure to realize the wanted or needed result' 3. 'Having the structure of idea of what is necessary to satisfy want or need as the objective result' Note: In order to have Wisdom 1. above, PMD method is effective and useful method to visualize among the concerned people. In order to have Wisdom 2. above, 'Method of Steplist Management' and the 'Method of 3-5 Improvement method are effective and useful method to create the procedures' In order to have Wisdom 3. above, 'FBS Technique for creating the most optimized image structures of objects,' is effective and useful method. All these methods and techniques actualize the means which people having wisdom traditionally use under consciousness.		
6	Have New knowledge after implementing the wisdom	After getting or during getting the objective result by implementing the wisdom above, we are able to become to explain the causation from wisdom. This causation is the exactly new knowledge. This new knowledge will be return to knowledge box of No.3 of this table. By doing this we can get the cycle of wisdom to knowledge, knowledge to wisdom. This is the wisdom engine cycle. Fuel for this engine is knowledge. To start this engine we have to have to make PMD(Purpose measure Diagram) Which is created from want or need or seed.		

In the method for changing Knowledge to Wisdom, there are the seven main methods by recognizing   of "Decision mechanism by information of difference"
(First four methods are the most important method)

1. PMD method for to create the Wisdom of Value
2. Steplist method to create the Wisdom of Procedure.
3. 3-5 improvement method to create the Wisdom of additional procedure
4. FBS technique to create the Wisdom of What.
5. WBS phasing theme method to create the most possible idea among the people concerned.
6. RO method to create the Wisdom of who realize it.
7. Implementation method to create the Wisdom of Implementation
